Forest monitoring and assessment

Robert Marušák, Peter Surový

Presentation outline

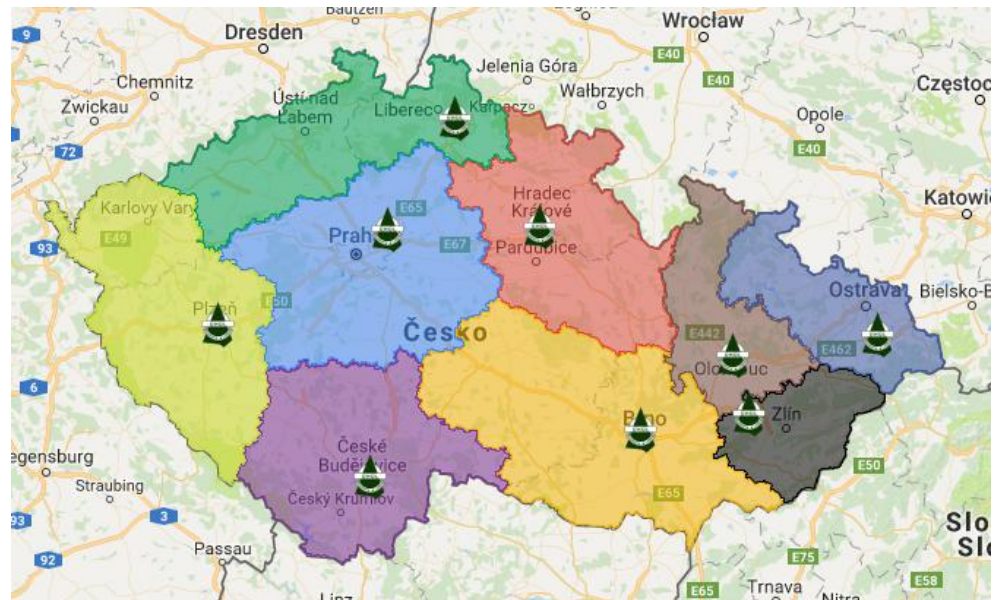

- Monitoring of the forest resources by remote sensing in Czech Republic
- Current trends and visions for future
- Research and technology in the Faculty of Forestry and Wood Sciences CULS

Monitoring of the forest resources by remote sensing in Czech Republic

- Mostly based on aerial scanning and photogrammetry
- Additional data sets available from satellite sensed data
- Main responsible entity :
UHÚL Frydek-Mistek (The National Agency for Forest Management)

Division of GIS and Remote Sensing

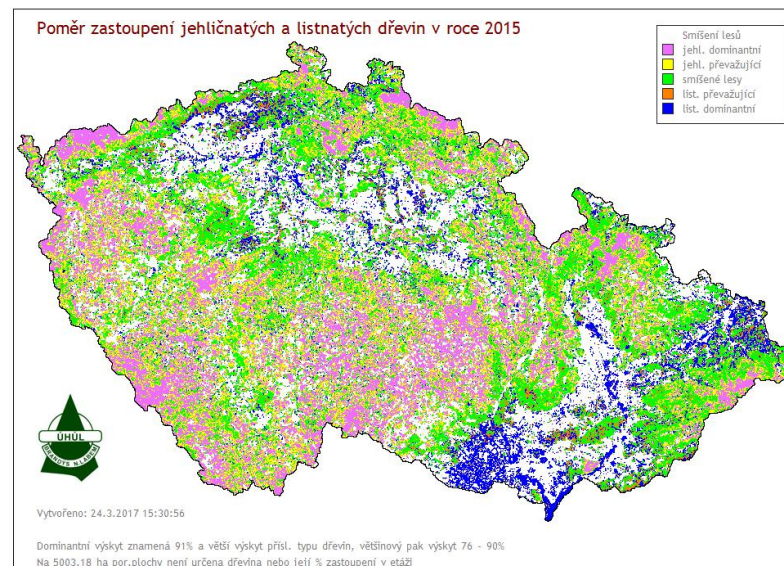

Available public map outputs :

- Forest species composition and cover
- Land Cover Map (forests, other land types)
- Forest harvest delineation
- Trends of forest health status
- Vegetation anomalies (2015)
- Normalized Difference Infrared Index (NDII) (2000-2015)

- Current trends and visions for future
- Research and technology in the Faculty of Forestry and Wood Sciences CULS

Current trends and visions for future

- The laser scanned data provided by second entity for aerial data acquisition

<http://www.cuzk.cz/>

are getting larger and larger attention by the forest stakeholder and decision makers.

Another big area of expected evolution and enhancement is utilization of Unmanned aerial vehicles (UAV)

- Europe is the leading country in UAV (more UAV in Europe than in the rest of the world)
- Legislation differs though
- So far only technical opinion published by EASA (industry development and privacy and security)
- In CR there is currently 300 m above ground level space for UAV utilization
- Certified pilots are required

Presentation outline

- Monitoring of the forest resources by remote sensing in Czech Republic
- Current trends and visions for future
- Research and technology in the Faculty of Forestry and Wood Sciences CULS

Drone types available:

1 - Copters

Quadrocopter DJI F450

Octopter Steadidrone ei8ht

Most recent: DJI S 900

Drone types:

2 - Planes

Maja airplane

Wings

Fixed wing

Available sensing equipment

Visible

Sony α6000

GoPro Hero

Multispectral

Sequoia

Thermo

FLIR Tau 2

Workswell
Wiris

- Laser scanning

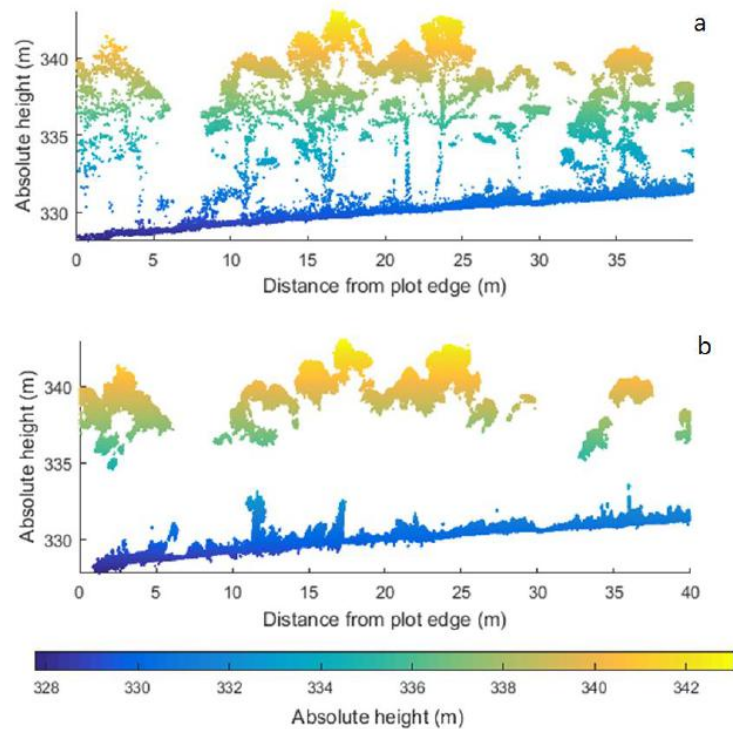

Professional (dedicated) equipment

Riegl, ...

Model based equipment

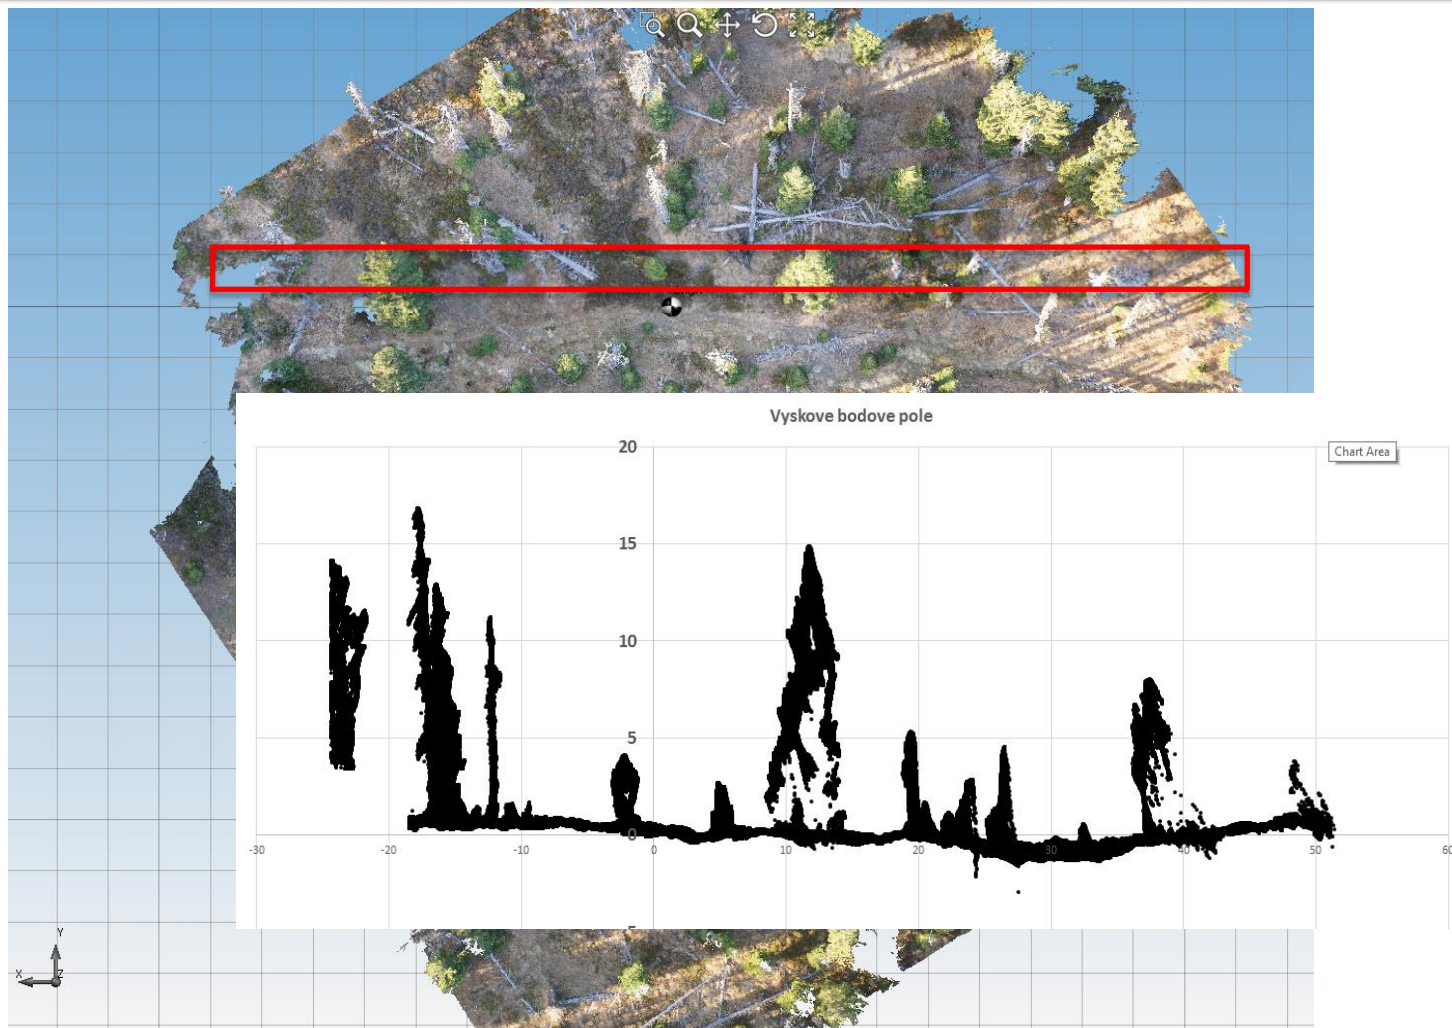

Wallace, L.; Lucieer, A.; Malenovský, Z.; Turner, D.; Vopěnka, P.
Assessment of Forest Structure Using Two UAV Techniques: A
Comparison of Airborne Laser Scanning and Structure from Motion (SfM)
Point Clouds. *Forests* 2016, 7, 62

The methods are based on grey level intensity

The novelty here is in height estimation from UAV clouds (Wallace 2016, Pulliti 2015)

The common consensus on 80% image overlap does not apply here!

Please read:

Surový, P.; Yoshimoto, A.; Panagiotidis, D. Accuracy of Reconstruction of the Tree Stem Surface Using Terrestrial Close-Range Photogrammetry. Remote Sens. 2016, 8, 123

Accuracy of 3D point reconstruction using SFM technique

3D point clouds

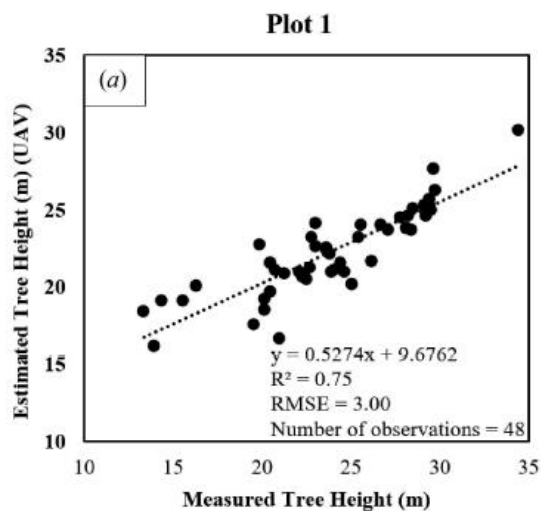

Height is possible to measure automatically

Automatic analysis is
advancing

Panagiotidis D, Abdollahnejad A, Surovy P, Chiteculo V (2016) Determining tree height and crown diameter from high-resolution UAV imagery, International Journal of Remote Sensing

Automatic detection of crop damage

Manually detected crop damage

UAV thermo camera = animal detection

Combination of optical and thermal camera

Area for 16+1 cooperation

- Testing of prototype devices, verification of data collection procedures in forest environment, derivation and processing of point clouds
- Data acquisition by current hi-tech forest mensuration tools
- Data processing for inventory purposes
- Forest health monitoring by remote sensing (visible and multispectral images)
